Claims

1. A method for inhibition of tumorigenesis in an individual suffering from or at [1] risk for a tumor type that expresses a6b4 integrin, comprising the steps of administering to the individual a therapeutic agent effective to reduce the amount of active a6b4 integrin at least in a portion of the individual where tumorigenesis may occur by targeting the beta 4 portion of the integrin. 2. The method of claim 1, wherein the individual is human. [2] [3] 3. The method of claim 1 or 2, wherein the therapeutic agent is an antibody. [4] 4. The method of claim 1 or 2, wherein the therapeutic agent is an antisense oligonucleotide. [5] 5. The method of claim 1 or 2, wherein the therapeutic agent is an RNAi species. [6] 6. The method of any one of claims 1 to 5, wherein the individual is suffering from or at risk for a tumor type selected from the group consiting of thyroid, breast, prostate and cervical cancers, cancer of the upper gastrointestinal tract and squamous carcinoma of the skin 7. The method of any of claims 1 to 6, further comprising the step of ad-[7] ministering to the individual an inhibitor of a receptor protein tyrosine kinase such as ErbB2, EGF-R. Met and Ron. 8. Use of an inhibitor of a6b4 integrin that targets beta 4 in the preparation of a [8] pharmaceutical composition for inhibition of tumorigenesis. [9] 9. Use of claim 8, wherein wherein the therapeutic agent is an antibody. [10] 10. Use of claim 8, wherein the therapeutic agent is an antisense oligonucleotide. 11. Use of claim 8, wherein the therapeutic agent is an RNAi species. [11][12] 12. Use of any of claims 8 to 11, wherein the pharmaceutical composition is suitable for human administration.
